Pika-Bots Discord Helper Bot

Response to **Final Report**, Page 1/3

13 December, 2025

Hi Team!

The reports represented a strong capstone that reflects sustained effort, collaboration, and care in responding to my company needs.

The students have proved a solid understanding of **systems analysis, Agile methodology, modern cloud-based tooling, and even cost savings.** The report shows confidence in **technical vocabulary, APIs, visual communication, and adapting to changes**, as well as finding a successful backup plan when some dependencies changed beyond their control, which was excellent.

The helper bot was implemented practically within their test Discord, then my Discord, and the project was supported by a set of design and technical information architecture diagrams. I'm glad to see meaningful learning occurred across tech, organisation, and communication.

There was a **small amount of repetition however** across diagrams and sections, which made parts of the document feel heavier than necessary. **With more selective prioritisation and synthesis**, focusing on why certain decisions mattered rather than documenting and reading aloud every detail, I believe the overall clarity and impact would be even stronger. In a real office setting, discussion time is more limited, compared to a university research paper, so that's why I am recommending slightly more conciseness in future real-world settings.

My only other suggestion is that there were a few places where certain challenges were framed as current pressing issues, when to me they felt more like thoughtful, future-facing considerations based on the three personas. For example, ideas around repeated questions or Discord overwhelm aren't something I'm experiencing yet (due to being new), but it is future-proof, so adding that clarity around whether they relate to the **immediate needs or the scaling** would help keep the report clear and true. In UX design terms, this is also similar to the distinction between a **provisional persona** vs. **persona** informed by research, and drawing those distinctions more explicitly could strengthen overall clarity.

.

Pika-Bots Discord Helper Bot

13 December, 2025

Aadarsh Karki — Co-Project Manager, Backend & Bot Operations Lead
You took on a significant technical leadership role in this project, particularly in backend development, deployment, and system reliability. Your work on the hybrid caching approach and handling unreliable external data sources demonstrates strong practical problem-solving skills and an awareness of real-world constraints. You show strong tech lead potential, and developing delegation skills over time will help support that growth, as it's a role that comes with its own responsibilities.

Syed Mustafa Ahmed Hashmi — Co-Project Manager, AI & Systems Architecture Lead
Your contribution to system architecture, AI integration, and overall coordination is evident in the report. The architecture diagrams and data flow explanations show thoughtful planning and a solid grasp of modular design principles. I also appreciated your early and consistent communication in Discord, which helped build clarity, and your involvement in Agile coordination reflects developing leadership skills.

Abdul Raheem Mohammed — Integration & QA Lead
Your role in testing and quality assurance provided important stability to the project. The structured testing approach, attention to edge cases, and focus on predictable behaviour demonstrated incredible system reliability. As systems grow or have unusual spikes, evolving testing strategies will be a natural next step in real-world scenarios.

Tania Gupta — UX & Branding Lead
You contributed clear value through your focus on usability, branding, and user experience within a Discord-based environment. While a bot or agent's voice and icon are important, even more critical are user flows that support real-world habits and explain why people use software in the first place. So your attention to tone, clarity, and the approachability of the character, along with pre-existing Discord expectations such as slash-commands shows good strategy. To strengthen in a possible v2, using user feedback or usability studies to prove design decisions (I know we didn't have a lot to go off here though) and maybe exploring ideations of orange kangaroo or woman in an orange kangaroo hoodie, instead of Pikachu-like, could further reinforce the Hackeroos brand.

Shashi Bala — Research & Methodology / Analysis Lead
Your industry research, contribution to methodology, and analytical framing helped anchor the project in good practice. Your work on Agile processes and iterative dev cycles shows strong understanding and alignment with industry norms, and could translate well into product or project management contexts, or data analysis. Further reflecting on where methods (including those used by others) were imperfect or constrained, and summarising those insights, could add even greater analytical depth. Please always feel comfortable taking up even more space in future real-world meetings, as your perspective is valuable.

Aagnya Chaulagain — Documentation & Feedback Support Lead
You played a key role in shaping the narrative of the report. Translating technical work into a structured document that addresses both client and academic expectations is a key skill. The report benefits from your focus on visual clarity and clear communication of the details. With time, tighter editing and synthesis would help reduce repetition and make it easier for a client to focus on the main points, and any actions they may need to take. Overall, the depth and completeness of the doc suggest a strong fit for technical documentation and developer-facing materials, such as GitHub READMEs or implementation guides. These are critically important in many orgs, and continuing to develop concise TL;DR-style summaries will help balance this strength for executive-facing contexts.

Overall, this is a high-quality submission that meets expectations. It reflects teamwork, role ownership, and helping people looking for and co-working on hackathons, while it could benefit for further refinements. **I'm open discussing a PikaBot v2 iteration in May** for those available, provided I have funding, and strengthening what's already there. Also **the team is welcome to attend Elastic's Sydney Hackathon on March 2nd in the AWS office!** There will be mentors with ElasticSearch & Amazon cloud, and good for trying out a big office setting to see if that's more your thing, vs. startups like mine, so register soon as space is limited to 60 people. Food will be provided: https://events.elastic.co/sydneyhackathon

Warm regards,
Kasey Robinson
